

MAHALO ENTERPRISE

Landing Page — Requirements Document

Version 1.0 | April 2025
Confidential — Internal Use Only

1. Project Overview

Client	Mahalo Enterprise
Target Market	United States
Language	English
Domain	mahaloenterprise.com
Notification Email	noreply@mahaloenterprise.com

1.1 Business Description

Mahalo Enterprise is a dealer (reseller/intermediary) of internet and telephone service providers in the United States. The company acts as a sales agent, capturing customer data and registering orders directly with the contracted providers.

1.2 Supported Providers

- Kinetic
- Brightspeed
- Frontier
- EarthLink
- Optimum
- Verizon Fios
- AT&T
- Spectrum

1.3 Business Model

Mahalo Enterprise agents act exclusively as intermediaries. They do not process payments directly. Once a customer completes registration on the landing page, an agent contacts them to verify identity data (SSN and date of birth) and then registers the order with the corresponding provider. The provider handles billing and payment processing.

2. System Architecture & Technology Stack

2.1 Technology Stack

Layer	Technology
Frontend Framework	Next.js (App Router)
Styling	Tailwind CSS
UI Components	shadcn/ui
Database	PostgreSQL
Authentication	Clerk
Email Notifications	Resend
Containerization	Docker Compose
Deployment	Dokploy (VPS)
Address Validation	USPS API
Webhook Automation	n8n (configurable URL)

2.2 Application Structure

The system consists of two main modules within the same Next.js application:

- Public Landing Page — accessible at the root domain (mahaloenterprise.com)
- Admin Panel — accessible at a protected route (e.g., /admin), requiring authentication via Clerk

3. Public Landing Page

3.1 Design & UX Guidelines

- Mobile-first responsive design
- Professional, clean, and trustworthy aesthetic
- Primary emphasis on the purchase funnel (address search and plan selection)
- Informational sections complement but do not overshadow the main CTA
- Provider-branded plan cards using each provider's corporate colors and logo
- Logo and color palette for Mahalo Enterprise: to be defined by client

3.2 Navigation & Informational Sections

A top navigation menu allows access to the following sections of the landing page:

1. Hero Section — Main headline with address/ZIP code search as the primary CTA
2. Why Choose Us — Key benefits and value proposition of using Mahalo Enterprise
3. Available Providers — Logos of all supported providers
4. How It Works — Simple step-by-step explanation of the process
5. FAQ — Frequently asked questions
6. Testimonials — Customer testimonials
7. Footer — Legal links (Terms & Conditions, Privacy Policy, Contact)

3.3 Purchase Flow

The purchase flow is a multi-step process embedded in the landing page. Below is a detailed description of each step.

Step 1 — Address / ZIP Code Search

- The user can enter either their full address or ZIP code
- The USPS API is used to validate and resolve the input
- Both input types are supported via the available USPS endpoints
- The ZIP code obtained is used to query provider availability in the database

Step 2 — Provider & Plan Selection

- If coverage is available: a success message is displayed (e.g., "Great news! We have internet available in your area!")
- If no coverage: an appropriate message is shown
- Available providers for the area are displayed with their plans
- Plans are displayed as visual cards with the following attributes:
 - Provider logo at the top of the card

- Card colors aligned with the provider's corporate branding
- Plan name and speed
- Price
- Key features list
- Call-to-action button (e.g., "Select Plan")
- Display order: providers first, then plans per provider — or all plans grouped; to be confirmed during design

Step 3 — Optional Add-Ons

- Displayed only if the selected provider has add-ons configured in the admin panel
- Add-ons are optional services the customer can include (e.g., 24/7 Home Technician Protection Plan at an additional monthly fee)
- Each add-on shows name, description, and price
- Customer can select one or more add-ons or skip this step

Step 4 — Order Summary

- Displays a full summary before proceeding to checkout
- Included details:
 - Selected provider and plan details
 - Base plan price
 - Selected add-ons and their prices
 - Total estimated amount
 - Installation address

Step 5 — Customer Information (Checkout)

The following fields are collected:

- First Name
- Last Name
- Email Address
- Phone Number
- Phone Type (Mobile or Landline) — informational only
- Installation Address — pre-filled from Step 1; editable
- Billing Address — option to use a different billing address; if selected, fields include: Street, City, State, ZIP Code (same structure as installation address)

Step 6 — Payment Preference

- Customer selects Autopay ON or OFF
- Price difference between autopay and non-autopay options is clearly displayed
- If Autopay is ON, customer selects payment method:

- Credit / Debit Card: card number, cardholder name, expiration date, CVV
- Bank Account (ACH): routing number, account number, account type
- Payment data is stored in the database in plain text (no payment processor integration)
- Note: This data is used by the agent to register with the provider. PCI compliance is the responsibility of the client.

Step 7 — Installation Scheduling

- Customer selects a preferred installation date and time using a calendar picker
- Available days: Monday through Saturday only
- Available hours: 8:00 AM to 5:00 PM
- Only future dates and times are selectable (no same-day or past scheduling)

Step 8 — Order Confirmation

- A success screen is displayed confirming the order has been received
- The message informs the customer that an agent will contact them to verify their date of birth and Social Security Number to finalize the order
- No payment is charged at this stage
- A notification is triggered (see Section 5 — Notifications)

4. Admin Panel

4.1 Authentication

- Authentication is handled via Clerk
- Only authenticated users can access the /admin route
- User management (invite, deactivate) handled through Clerk's dashboard

4.2 User Roles

Role	Permissions
Admin	Full access: manage providers, plans, add-ons, coverage, users, settings, orders, customers
Agent	View and manage orders and customers; view providers and plans (read-only)

4.3 Provider Management

- Create, edit, and deactivate providers
- Fields per provider: name, logo (image upload), corporate primary color, active/inactive status
- Each provider can have multiple plans associated

4.4 Plan Management

- Create, edit, and deactivate plans per provider
- Fields per plan: name, speed, price (with autopay / without autopay), features list, active/inactive status
- Plans can be reordered for display priority

4.5 Add-On Management

- Create, edit, and deactivate add-ons per provider
- Fields per add-on: name, description, price, active/inactive status
- Add-ons are optional; if a provider has no active add-ons, Step 3 of the purchase flow is skipped

4.6 Coverage Management (ZIP Codes)

- Assign and remove ZIP codes per provider
- The system checks the database to determine which providers are available for a given ZIP code
- Bulk import of ZIP codes should be considered (e.g., CSV upload) — recommended for future implementation

4.7 Order Management

Agents can view and manage all incoming orders.

Order statuses:

Status	Description
Pending	Customer completed the online registration. Awaiting agent verification.
Created	Agent registered the order with the provider.
Scheduled	Installation has been scheduled / rescheduled.
Installed	Installation was completed successfully.
Completed	Service is active and the order is fully finalized.
Cancelled	Order was cancelled by the customer or agent.

Order detail view includes:

- Full customer information
- Selected plan and provider
- Add-ons selected
- Payment preference and payment data
- Installation address and billing address
- Scheduled installation date and time
- Order status history (timeline of status changes with timestamps and agent responsible)
- Ability to reschedule installation date/time from the panel

4.8 Customer Management

- View list of all registered customers
- View full customer detail: personal info, orders history, status

4.9 General Settings

The settings module uses a flexible key-value structure to allow future extensibility beyond the current fields.

Current configurable parameters:

- Notification email address (destination for new order alerts)
- Webhook URL (n8n endpoint for automation; triggered on new order)
- Additional settings can be added without schema changes

5. Notifications

5.1 New Order Notification

Triggered immediately when a customer completes Step 8 (order confirmation).

- Email Notification — sent via Resend to the configured notification email address; includes order summary
- Webhook — HTTP POST request sent to the configurable n8n webhook URL; payload includes full order data in JSON format
- Both the email address and webhook URL are configurable from the admin settings panel

5.2 Customer Notifications

Customer-facing notifications (e.g., order confirmation, appointment reminders) are handled externally via n8n workflows triggered by the webhook. No direct customer email is sent from the application.

6. Data Model Overview

The following entities represent the core database structure. Exact schema (column types, indexes, constraints) to be defined during development.

providers

- id, name, logo_url, primary_color, is_active, created_at, updated_at

plans

- id, provider_id, name, speed, price_standard, price_autopay, features (JSON array), is_active, sort_order, created_at, updated_at

add_ons

- id, provider_id, name, description, price, is_active, created_at, updated_at

provider_coverage

- id, provider_id, zip_code, created_at

customers

- id, first_name, last_name, email, phone, phone_type, installation_address (JSON), billing_address (JSON), created_at, updated_at

orders

- id, customer_id, provider_id, plan_id, add_on_ids (JSON array), autopay_enabled, payment_method, payment_data (JSON — encrypted recommended), scheduled_at, status, created_at, updated_at

order_status_history

- id, order_id, status, changed_by (agent user id), notes, created_at

settings

- id, key (unique string), value (text), description, created_at, updated_at
- Extensible key-value store. Current keys: notification_email, webhook_url

7. External Integrations

Service	Purpose	Configuration
USPS API	Address validation and ZIP code resolution	API credentials via environment variables
Clerk	Admin panel authentication	Clerk dashboard + env variables
Resend	Email notifications to agents/admin	API key via env; email configured in admin panel
n8n Webhook	Customer notifications and automation workflows	URL configured in admin settings panel

8. Pending / To Be Defined

- Mahalo Enterprise logo and corporate color palette
- Visual design references or mood board for the landing page
- Final decision on provider/plan display order in Step 2 (providers first then plans, or all plans together)
- CSV bulk import for ZIP code coverage (recommended for future sprint)
- Legal texts: Terms & Conditions and Privacy Policy content
- Specific content for FAQ and Testimonials sections
- USPS API credentials
- Clerk application setup and user invitation flow
- Resend API key and sender domain verification
- Encryption strategy for payment data at rest (currently plain text — security review recommended)

This document was prepared based on requirements gathered in a structured interview session. It should be reviewed and approved by the client before design and development begin.
